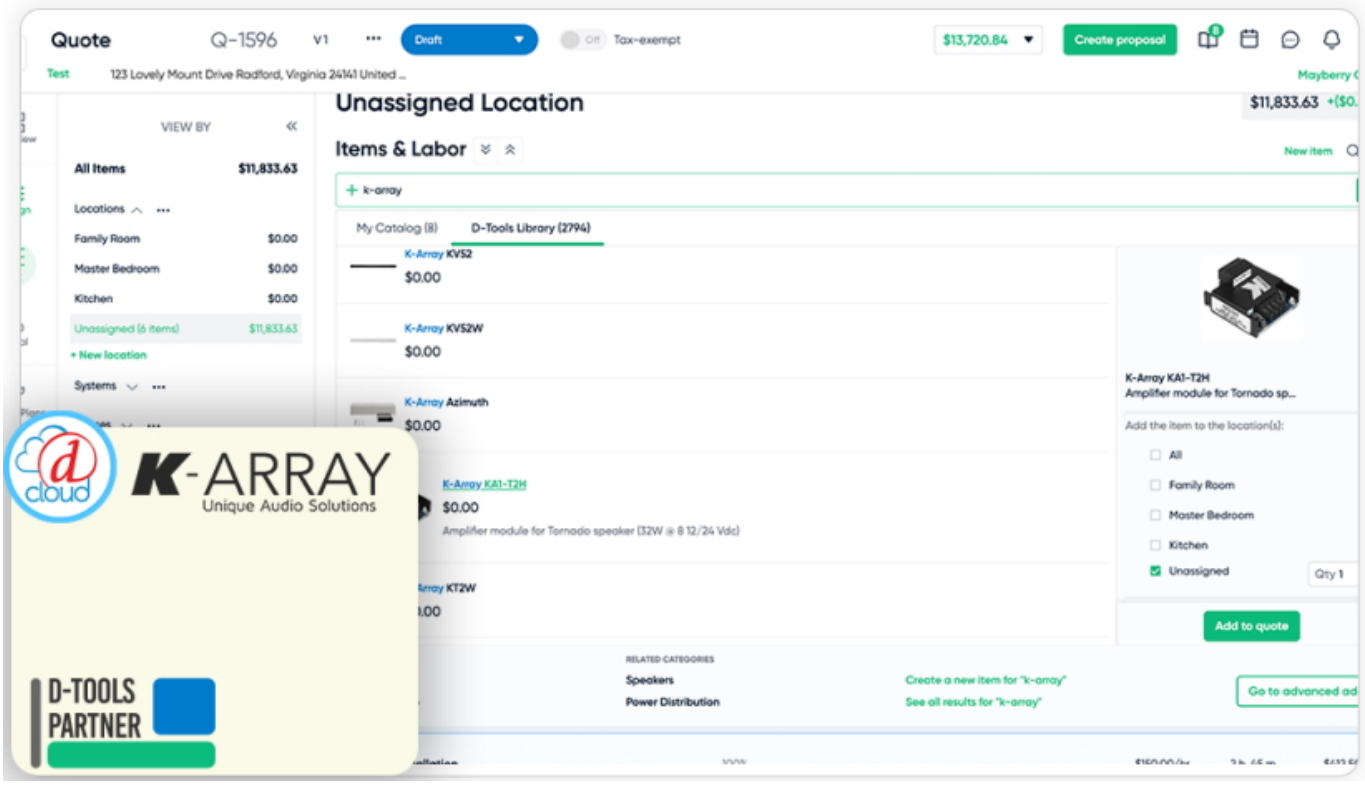
K-array Audio D-Tools Compatibility



Italian manufacturer of innovative audio technologies, K-array, has announced that its full product catalogue is now available for specification within D-Tools. Integrators and dealers across the UK and US can now use D-Tools SI and D-Tools Cloud to specify and quote K-array, K-array Marine, KGEAR and KSCAPE systems within their workflow, with other markets to follow.

The complete K-array range is available as a structured, searchable library directly within the popular D-Tools platforms that AV integrators and dealers already use for system design, estimation and project management. Product specifications, pricing and imagery are all accessible within D-Tools, so specifiers no longer need to step outside their workflow to source data, build line items manually or reconcile pricing from external sources. For channel partners working across multiple product lines and manufacturers, removing friction from even one part of a project can meaningfully accelerate the design and quoting process.

Both D-Tools SI, which serves enterprise estimation environments, and D-Tools Cloud, used by a broad base of dealers and smaller integration firms, are covered by the integration, meaning the update reaches across the full spectrum of the professional AV installation community.

Tom Riby, global business development manager at K-array, said, "K-array’s growth has always been driven by integrators and dealers who push our systems into projects where design and acoustic performance matter equally. Making our full

catalogue available inside D-Tools, across both SI and Cloud, removes a real piece of friction from their day. Our partners can now specify, quote and design K-array systems inside the workflow they already trust, without breaking stride to chase data from somewhere else. It’s a practical step that makes us easier to work with, and that’s the relationship we want with the channel."

"We’re pleased to welcome K-Array to the D-Tools i3 Partner Program,” said Barrie McCorkle, Director of Business Development at D-Tools. “This partnership gives thousands of integrators and end users leveraging D-Tools Cloud and D-Tools SI direct access and trust in their authorized data from K-Array. A win for all, making it easier to specify, propose, and deliver high-performance professional audio solutions across live events, hospitality, marine, commercial, and residential AV solutions.”

The solutions now available within D-Tools reflect the full breadth of K-array’s product offering. The core K-array portfolio comprises compact line arrays, point-source systems, subwoofers and installation speakers that offer exceptional acoustic performance in enclosures that are smaller, lighter and less visually intrusive than conventional alternatives. K-array Marine extends that philosophy to the marine and superyacht sector, where space constraints and environmental demands are key considerations. KGEAR brings the group’s engineering approach to a wider audience with accessible, high-quality audio solutions, while KSCAPE unites architectural audio and lighting in a single, coherent system.
