IK Multimedia ReSing Japanese Language Pack

IK Multimedia, an innovator in music production technology, today announces the release of the ReSing Voices Japanese Pack, the first language-specific expansion for its AI-powered vocal and instrument modeling platform. With the introduction of 10 new vocal models, this release marks an important step in ReSing's evolution toward a global ecosystem for voice creation, with additional languages already in development. ReSing is a plug-in and standalone application that enables producers to transform vocals and instruments using expressive, performance-ready models built from real artists. Running entirely on the user's computer, ReSing offers precise control over pitch, timing, articulation, and expression, delivering natural results without cloud processing or subscriptions.

Designed to expand creative possibilities for Japanese-language productions, the ReSing Japanese Pack features 10 unique vocal models covering a wide range of tones, styles, and expressive characteristics. From bright, modern J-pop vocals to deeper, more resonant voices with character and intensity, the collection offers a versatile palette suited for contemporary music, media, and sound design.

As the first language-specific expansion, the Japanese Pack also introduces native-language support for model creation. Users who purchase the pack can create their own voice models in Japanese, opening new opportunities for artists, producers, and creators working across global markets. All voices in the ReSing Japanese Pack are created from original recordings made specifically for ReSing, with full artist consent and fair compensation. This transparent approach ensures that every model is ethically sourced, giving users confidence in both the quality of the results and the integrity of the technology.

With the introduction of language-specific packs, ReSing continues to grow into a platform for global music production. Each new release expands not only the available voice library but also users' ability to create and work in additional languages. Future expansions will introduce more voices, styles, and regions,

supporting a wider range of musical cultures and creative workflows.

Singers interested in participating in the ReSing ecosystem can also apply to join the Session Singers Showcase, where artists make their voices available to producers worldwide. With the introduction of Japanese-language support, IK Multimedia is now expanding its search for new vocal talent in Japan and beyond. The ReSing Voices Japanese Pack is available now as an add-on for ReSing and can be purchased through the IK Multimedia online store or authorized dealers.
