BOOM Library SEASONS OF EARTH – EUROPEAN WINTER

BOOM Library has announced the release of SEASONS OF EARTH – EUROPEAN WINTER, the latest addition to its professional sound effects catalogue. Recorded across Scandinavian and Central European locations, the collection offers an unfiltered portrait of winter, designed for film, television, games, and immersive audio formats.

From the deep creak of frozen lakes to the silence of snow-covered tundra, with the distant calls of foxes, wolves, and ravens, EUROPEAN WINTER delivers geographic specificity and Atmos-ready fidelity. All recordings were captured in the field using Schoeps ORTF-3D arrays, ensuring spatial accuracy and immersive depth. Both 3D Surround and dedicated stereo versions are included, with no fold-downs and no synthetic enhancement.

The library focuses on rare and hard-to-capture details often absent from conventional winter collections, such as:

- Singing lake ice caused by temperature shifts
- Semi-frozen streams with internal movement
- Wildlife activity during extreme weather windows
- Windless tundra atmospheres where silence defines the tone

Organised for easy integration into professional workflows, each file is phase-accurate, metadata-rich, and ready for Atmos, surround, stereo, and spatial mixing.

“Silence only works if it’s clean,” says field recordist Shane Witzler. “These sounds are exactly as they occurred – no foley, no added effects – just the patience and precision required to capture them.”
