Ferncast at IBC 2024

Ferncast, a provider of 24/7 audio logistics solutions, has announced it will unveil the newest aixtream software features and upcoming products at the IBC 2024. These include AI-driven voice generation, immersive audio for radio, automatic loudness control equal to a Tonmeister, and advanced radio scheduling tools. All of these features will be shown integrated with each other for maximal synergy as part of a complete live demo setup.

Visitors at Ferncast booth will experience the future of radio first-hand with this complete on-site demo of the upcoming features. They will get a chance to schedule a complete radio program, enable and disable specific audio features and enjoy the result of their work immediately - including loudness-processed and immersive audio songs as well as AI-generated voice moderation in-between. Choose songs, choose how to process them, choose your moderator voices, what they should say and how. Then, listen to your playlist and get a sense of the outstanding audio quality provided by the new options proposed by Ferncast. This will be the first time people get a chance to try Ferncast’s next-generation loudness control live and experience immersive audio content encoded by Ferncast solutions.

In addition to this extensive demonstration, visitors can look forward to a hands-on experience of Ferncast’s fernReport, and to the traditional paper plane competition to get a chance to win this next generation reporter codec. Ferncast experts await you at the IBC in Hall 8, stand 8.F80.
