Krotos Image-to-Sound

Krotos, a company with expertise in sound design software, announces the world's first commercial Image-to-Sound feature as part of AI Ambience Generator v2 for Krotos Studio. This update enables creators to generate audio ambiences directly from an image, eliminating the need to sift through extensive sample libraries. With AI Ambience Generator v2, film makers, video editors, sound designers and game developers can stay in their creative flow saving hours, and focusing on what matters the most, the creative output.

Earlier this year, Krotos introduced AI Ambience Generator v1, a text-based tool that allowed users to describe a scene and quickly receive a unique ambience preset. Building on that foundation, AI Ambience Generator v2 takes innovation a step further. By providing an image - whether it's a film still, a video screenshot, or concept art - the AI generates a custom prompt. Users can refine this prompt, and Krotos Studio produces a tailored preset, transforming visuals into sound. Users working with AI-generated videos often need to add their own sounds to silent visuals, and now they can take a still from their video and quickly bring the scene to life with precision and ease.

Key Features
