

# RØDE extends Bluetooth Connectivity

RØDE has today announced a major free firmware update across its premium wireless range, with Wireless GO (Gen 3) and Wireless PRO now boasting Direct Connect, a powerful capability that allows users to connect directly to iOS devices without the need for a physical receiver. Direct Connect, first introduced with Wireless Micro, enables Wireless GO (Gen 3) and Wireless PRO transmitters to pair with iPhones via Bluetooth® using the free RØDE Capture app. This eliminates the need for any additional hardware or accessories, dramatically streamlining mobile setups while preserving the broadcast-quality audio both wireless systems are known for.

"We've already witnessed the incredible impact Direct Connect has had on creators using the Wireless Micro," said Damien Wilson, CEO of RØDE. "Since launch, feedback has been overwhelmingly positive, allowing creators more flexibility and versatility than ever before. It's our duty as pioneers of the ultra-compact wireless microphone category to extend true wireless freedom to as many creators as possible. With Direct Connect now available on more RØDE systems, we're delivering exactly that."

With Direct Connect now available across more of the wireless range, creators can continue to record in merged or split modes through the RØDE Capture app. In

merged mode, audio from both transmitters is combined into a single, ready-to-publish stereo track. In split mode, each transmitter is recorded to a separate channel for greater flexibility in post-production. In-app output gain control also makes it easy to adjust recording levels on the fly for consistently balanced results. This powerful new functionality comes at no extra cost to users and, following recent price drops of 33% for Wireless GO (Gen 3) and 25% for Wireless PRO, offers even greater value for creators looking to simplify their mobile setups without sacrificing sound quality.

The third generation of the iconic Wireless GO, Wireless GO (Gen 3) builds on the success of the world's most popular wireless microphone platform, delivering every feature and convenience a creator could possibly need while keeping the intuitive grab-and-go operation the range is known for. Powered by RØDE's state-of-the-art Series IV 2.4GHz digital transmission and compatible with any Series IV device, it delivers pristine, reliable wireless audio, with advanced features like 32-bit float on-board recording, intelligent GainAssist for consistently balanced levels and generous 32GB internal storage for recording audio directly to the transmitters. With Direct Connect now on board, Wireless GO (Gen 3) becomes an even more streamlined solution for mobile creators, offering a cleaner rig and faster setup while maintaining the professional sound expected from RØDE. Available in an array of colours, it also gives creators the freedom to personalise their on-camera presence to suit their style.

Designed for filmmakers and professional creators who require maximum capability in a compact form, Wireless PRO is the most powerful system in RØDE's wireless range, delivering an unrivalled suite of features not found in any other compact microphone in its class. Building on the impressive core performance and capabilities of the Wireless GO (Gen 3), Wireless PRO adds timecode sync for quick-and-easy audio sync in post-production and an extended 260m line-of-sight range for reliable audio over longer distances. Compatible with the full RØDE Series IV ecosystem, including RØDECaster Pro II, RØDECaster Duo and RØDECaster Video, Wireless PRO is built for serious productions, now with the added convenience of Direct Connect for faster mobile capture when needed.

RØDE's Wireless GO (Gen 3) and Wireless PRO ship worldwide. The Wireless GO (Gen 3) is available to purchase in a range of vibrant colours for US\$199, while the Wireless PRO can be purchased for US\$299. Direct Connect is available now on the RØDE Capture app via a free firmware update.
