Dynaudio Acoustics Studio Amplifier Range

Dynaudio Acoustics, maker of reference systems for some of the world's most important professional studios and broadcasters, has announced the launch of its new range of power amplifiers. The Delta series consists of five models – all of which are built to deliver the same extreme reliability, consistency and performance as Dynaudio Acoustics studio monitor systems.

The range, built by MC2 in the UK, comes in both DSP and non-DSP versions for different room-tuning scenarios. The DSP version spans three dynamic and eight static EQ bands per input channel, along with nine static EQ bands per output (and a suite of additional features). All the models offer analogue audio and networked audio via Dante, making them virtually future-proof. And the range can be mixed-and-matched as your studio evolves. So, for example, you could start with the flagship 2U Delta 80 DSP and later add a Delta 20 with a single Cat 5 cable to create a stereo four-way system. Power is no problem. The smallest in the range, Delta 20, offers output from 175W to 480W per channel – while Delta 80 DSP goes up to a staggering 4x 2000W at 4 ohms, or 2x 5000W when bridged. All without breaking a sweat (or breaking up).

The range is available now. Contact Dynaudio for pricing information and delivery times.
