

HK Audio DSP CONTROL 4.2

HK Audio has released the latest software update for its popular DSP CONTROL software. The new 4.2 version includes several enhancements designed to streamline workflows and improve system management for audio professionals. DSP CONTROL is a comprehensive and easy-to-use software solution for Mac and PC. It provides precise sound tuning, firmware updates and remote control of the DSP parameters of all network-enabled HK Audio speakers.

The 4.2 release features a number of new features to make life easier for audio professionals. The new bulk update feature helps to speed up the workflow by allowing multiple devices to be updated simultaneously rather than waiting for individual devices to complete before starting on the next. With the 4.2 release, DSP CONTROL now provides 20 preset slots for each device, allowing greater flexibility for users. The release means that the software now has language support for five additional languages. Now French, Italian, Norwegian and Swedish users will be able to use the software in their native language.

The new software release also includes enhancements specifically for LINEAR 5 MK2 loudspeakers. With DSP CONTROL 4.2, the maximum delay time for LINEAR 5 MK2 systems has been increased to 50 ms. The certified MILAN functionality has also been improved.

“We are always trying to enhance and improve the software that the HK Audio family rely on every day, and the 4.2 release of DSP CONTROL is a good example of this,” stated Stephan Kuczera, Product Manager for Live Sound at HK Audio. “These upgrades have been driven by customer requests and should make life easier for audio professionals all over the world.”

DSP CONTROL 4.2 is available for download from the HK Audio website now.
