

SCHOEPS expands Modular Microphone Mounting System

SCHOEPS Microphones [Hall 8 – 8.D55] will present a major set of updates for its modular table and floor mounting system at IBC 2026. The updates include telescoping extension options, improved acoustic decoupling, integrated controls, and a nearly endless variety of customization options for fixed installation and broadcast applications. IBC 2026 is taking place at RAI Amsterdam from September 11-14, 2026.

The updated modular mounting system options benefit from a simple fact: at SCHOEPS, microphone and mounting technology are developed and produced under one roof. The engineers behind them often share the same office and talk to each other every day. The result is a wide range of compatible components for fixed installation and broadcast applications. SCHOEPS microphones and mounting solutions have long been favored by major government and cultural institutions, including parliaments and government institutions in Berlin, Bern, London, Brussels, and Jerusalem, valued for their clarity and fidelity, as well as customizable mounting options that suit both historic and contemporary facilities.

The new updates include additional flexible options for the TM series (in-table mounting), free-standing table stands, and floor stands, providing a versatile and

cost-effective solution for conference rooms, parliaments, broadcast facilities, and any other fixed site requiring live or recorded sound. All SCHOEPS products are engineered for maximum speech intelligibility, reliability, serviceability, and easy operation with minimal noise.

SCHOEPS will showcase the following new updates for attendees at IBC 2026:

- Telescoping Extension - Allowing increased flexibility and stability of microphone adjustment, with customizable options available by request.
- Improved Acoustic Decoupling - Superior noise handling regardless of integration into various structures such as tables and desks.
- Integrated Button - Direct control from the mount of the microphone.
- Improved Modularity - Components can now combine more freely, with the full Colette/CCM microphone series behind them.
- Customization - As with all SCHOEPS microphones and mounting products, SCHOEPS offers custom-engineered solutions for easy integration into any facility. Our engineers will work directly with customers and/or integrators to ensure perfect sound and fit.

"We're looking forward to showing our extended modular microphone mounting system hands-on at IBC this year," says SCHOEPS Co-CEO Helmut Wittek. "For the fixed installation and broadcast world, this system solves a real problem: reference-class sound combined with a versatile range of mounting options, available as an economical, off-the-shelf solution."

For Wittek, the key is the combination: "You can get one or the other from other manufacturers. But by combining both into a single system, with customization on top, we can ensure consistent sound quality and seamless integration for any facility."
