KLOTZ PowerLink

The new PowerLink Box by KLOTZ is an extremely robust and easy-to-use power distribution system that has been specially developed for use in harsh stage environments. Equipped with one powerCON TRUE1 input and five powerCON TRUE1 outputs, the new LV-NM5F box offers a current carrying capacity of up to 16A at 250V. This high-quality connector is characterised by its convenient and proven locking system and can be safely plugged in and unplugged even under load.

Despite its lightweight design, the 1.5 mm thick aluminium housing can withstand even the highest mechanical loads. A matt black powder coating provides reliable protection against external hazards and is also easy to clean. In addition to the M10 thread in the bottom of the housing, the PowerLink is also equipped with eight holes for secure attachment to the rig via a securing rope. The non-slip rubber feet also guarantee a firm stand, even on stage. Of course, this KLOTZ power distributor for live use complies with IEC 62368-1 and offers tested quality in accordance with VDE 0701-0702.
