

# Optimal Audio WebApp 1.4

Optimal Audio has announced that WebApp 1.4, the latest update for the ‘secret sauce’ of its ecosystem, is available to download. The new features in the update will further enhance the powerful simplicity of its approach. Optimal Audio’s mission is to simplify commercial audio with its ecosystem of controllers, amplifiers and loudspeakers – with Zone and WebApp central to that strategy.

The new features available in WebApp include presets for Optimal Audio’s Sub 6 loudspeaker. The Sub series is comprised of four subwoofers engineered for punchy low end to support the Up and Cuboid series. Sub 6 is an ultra-compact, passive 6-inch subwoofer that joined the wider series earlier this year to meet a requirement for high quality low end in a compact form factor. In addition, the update includes presets for sister brand, Martin Audio, and their ever popular ADORN commercial series of speakers. Presets for ceiling and pendant speaker models ACS-40TS, ACS-55TS, ACS-55T, ACP-55T complete the availability of ADORN series within WebApp, and join smaller CDD on-wall loudspeakers for easy system design options for installers.

Following the download of the new software version, users and integrators will also be able to see ZonePad firmware updates in the WebApp status bar. WebApp 1.4 is available to download now at the website below.
