Powersoft ‘DSP Only’ Install Range Extension

Italian audio specialists, Powersoft, today announced the launch of a product line extension enabling users to enjoy all the benefits of the full Quattrocanali and Duecanali range with ‘DSP only’ versions, making it more accessible and affordable to a wider range of users.

The much loved Quattrocanali and Duecanali range of Powersoft amplifiers have been re-engineered to offer a more streamlined and even more affordable ‘DSP-only’ option to the market, benefitting from all the advantages onboard DSP delivers in a professional amplifier.

DSP (digital signal processing) plays an integral part for installers wanting to digitally process audio signals to alter characteristics of the timing, spatial traits, frequency and phase without any analogue hardware to make this possible.

Thanks to the addition of DSP in professional audio amplifiers, not only does this eliminate extra unnecessary hardware, (i.e. extra cables), but DSP also opens the door to digital signal routing, which improves the likelihood of electronic failures and troubleshooting in an install.

Commenting on the benefits on this product line extension Luca Giorgi, Sales Director at Powersoft states: “Offering the full range of Quattrocanali and Duecanali to our users in ‘DSP only’ will simplify the way in which our technology can be used, by keeping the remote control capabilities that are necessary in an installation, so we hope this will be a welcome step for customers and clients wanting to try our products, perhaps for the first time.”

The full range of each amplifier is immediately available in ‘DSP only’ version, which includes: Quattrocanali 1204, 2404, 4804, 8804, and Duecanali 804, 1604, 2404,4804, 6404.
