

# Sennheiser TeamConnect Ceiling M Plus

Sennheiser, a company with expertise in advanced audio technology that makes collaboration and learning easier, today announced the launch of the TeamConnect Ceiling M Plus (TCC M Plus), a new ceiling microphone designed to deliver simplicity of use and clarity of sound, combining streamlined deployment with consistently clear, natural speech for every participant in the room.

Building on the success of the TeamConnect Ceiling portfolio, TCC M Plus, which will be showcased at InfoComm 2026, combines trusted Sennheiser audio performance with a new generation of features designed to reduce deployment effort, simplify system configuration, and support scalable AV environments. One of the key new capabilities included with TCC M Plus is PartnerLink, Sennheiser's integration feature designed to simplify how microphones are configured within leading AV platforms. The first implementation, co-developed through close engineering collaboration between Sennheiser and Q-SYS, enables the TCC M Plus to be directly configured within Q-SYS Designer Software. This allows for streamlined integration of audio and control alongside Q-SYS native components.

"Our collaboration with Sennheiser is focused on making it easier for customers and integrators to bring high-quality audio into Q-SYS," said Gary Evans, Director, Alliances, QSC®. "With the Q-SYS Extension for Sennheiser PartnerLink, we're streamlining deployment and making it simpler to incorporate Sennheiser audio and key elements of device control and automation while preserving the well-known

flexibility of the Q-SYS Full Stack AV Platform.”

PartnerLink is launching initially for Q-SYS environments and will expand to additional platforms over time. TCC M Plus continues to support Sennheiser’s open ecosystem approach, delivering reliable and validated integration options across a broad partner ecosystem. Beyond PartnerLink, TCC M Plus continues Sennheiser’s established approach to interoperability, supporting multiple integration methods to suit different system designs and customer requirements. Integrators can deploy Sennheiser microphones using trusted methods such as Dante and verified integrations, ensuring consistent workflows across a wide range of room types and platform environments. This flexibility allows organisations to standardise on Sennheiser audio while choosing the platforms and architectures that best meet their needs.

As hybrid work and learning environments continue to evolve, AV systems are becoming more connected and more complex. TCC M Plus is designed to address this shift by combining high-quality audio performance with simplified setup, commissioning, and management. With features such as dynamic beamforming and enhanced exclusion zones, the solution delivers clear, natural speech that adapts to changing room layouts and participant positions, ensuring every voice is heard without distraction. The enhanced exclusion zones simplify zone configuration, which significantly improves desired audio pickup in complex rooms and camera tracking reliability.

At the same time, TCC M Plus reduces the effort required to design, deploy, and manage systems, supporting a more consistent and predictable experience for integrators, AV/IT teams, and end users alike. Flexible installation options and a coverage area suited to medium and large spaces make it ideal for meeting rooms, classrooms, and divisible environments. TCC M Plus also supports scalable deployments through single-cable connectivity options and centralised management, helping organisations standardise solutions across multiple rooms and locations.

Alongside its integration capabilities, TCC M Plus integrates with Sennheiser’s DeviceHub, a cloud-based platform designed to simplify device management at scale. This integration allows for direct access to the TCC M Plus for configuration and monitoring, without the need to install tools. DeviceHub provides centralised visibility across rooms, buildings, and regions with remote monitoring, configuration, and diagnostics and role-based access for secure collaboration between AV and IT teams. This enables organisations to manage growing AV deployments more efficiently, reducing operational overhead while maintaining system performance.

TCC M Plus has been designed to meet the needs of integrators, AV/IT managers, and organisations deploying collaboration solutions at scale. By combining simplified setup and commissioning, with flexible, reliable integration options and centralised, cloud-based management, TCC M Plus ensures organisations can
