

Auribus Voice

Auribus has announced the launch of Voice by Auribus, a DAW-integrated vocal platform built around real singers – licensed, compensated, and amplified by AI. Built for music producers, composers, and engineers, the platform is both a vocal production tool and a modern reimagining of a vocal talent agency. To celebrate the launch, for a limited time, new users can get two months of the Standard Plan (worth \$40) for free. Auribus sets itself apart from many others by placing the artist at the centre in an industry grappling with the rise of synthetic content and unpaid data scraping. Every voice in the Auribus catalogue belongs to a real performer who is paid each time their model is used. No grey areas. No compromises.

“We’re not replacing vocal talent,” said Juan Elias, founder of Auribus. “We’re using technology to help singers reach further – across geography, across time zones, and across projects they might otherwise never access.” Every model is created with consent from the artist, using high-quality recordings, and comes with a royalty framework that pays singers every time their voice is used, even in demos.

The plugin fits directly into most major DAWs supporting AU, VST, and AAX, offering instant access to a growing range of artist voices and full creative control through pitch, prosody, tone, and accent tools. Unlike fixed sample packs, each voice model in Auribus is deeply customisable, making it possible to shape performances without losing authenticity. Whether you’re building demos at speed, crafting a pitch for a sync brief, or replacing a guide vocal in a session that’s missing the singer, Auribus puts real voices in reach. Use it for songwriting sessions, remote

collaborations, vocal harmonies, or experimental sound design.

Voice by Auribus is more than a tool – it's a platform that creates real opportunities for real vocalists. With every use tracked and paid, artists get the exposure of a global session network, without ever stepping into the room. Coming soon: a dedicated artist spotlight feature, telling the stories behind the voices.

Features:

- Synthesized Voice: Mimics the input voice for consistent, natural results.
- Pitch & Tone Adjustment: Customize pitch to create unique vocal effects.
- Prosody Modification: Adjust rhythm and intonation for expressive performances.
- Language & Accent Adaptation: Expand possibilities with multilingual support.
- High-Quality Audio Output: Ensures studio-grade sound with minimized distortions.

Voice by Auribus is offered with a choice of plans to accommodate different producers' needs, as outlined in the table below. From May 8th - July 17th, new users will get two months of the Standard account for free – a saving of almost \$40.
