

## **Black Lion Audio PBR XLR 16F DSub**

Black Lion Audio announces the PBR XLR 16F DSub, a 16-point female XLR/DB25 patchbay designed to eliminate cable chaos while preserving the highest standards of audio fidelity. Purpose-built for modern studios, the PBR XLR 16F DSub allows engineers to connect up to 16 microphones to mixers, audio interfaces, or outboard hardware in a single rack space without compromising signal integrity.

Accessible patching is only part of the equation. Drawing upon years of experience refining professional audio equipment through its renowned modification service, Black Lion Audio engineered the PBR XLR 16F DSub to deliver exceptional audio quality throughout the entire signal path. 16 audiophile-grade, gold-plated female XLR connections ensure maximum conductivity, signal clarity, and longterm reliability.

On the rear panel, dual DB25 connectors provide a clean, efficient interface to mixers and audio interfaces. The connectors are securely mounted to an internal steel backplate, protecting against wear and tear from reconnections. With the PBR XLR 16F DSub in place, engineers can make the required connections efficiently and focus on the session at hand.

The PBR XLR 16F DSub is housed in a reinforced steel chassis with black-anodized aluminum faceplates, delivering durability that stands up to daily professional use while maintaining a refined, cohesive aesthetic alongside other Black Lion Audio gear. Custom patch labels are included for immediate setup and organization, with additional labels available at [blacklionaudio.com](http://blacklionaudio.com) or through Black Lion Audio's partners at PatchCAD.

The PBR XLR 16F DSub will be available for pre-order beginning January 7, 2026, shipping through Black Lion Audio's growing global network of dealers and distributors in January 2026 with a US price of \$349.00 USD and an EU price of €465.00 EUR.
