

CEDAR Audio Voxis

CEDAR Audio announces the latest addition to the ICONS range of creative software plug-ins – Voxis. Voxis is a low-latency neural network voice isolator that has been optimised for live environments where audio professionals have to contend with troublesome background noise. Background noise in environments such as conferences, music concerts and live sports events can be undesirable and extremely hard to manage. Voxis gives audio professionals a more effective way of dealing with this problem.

A sub-10 millisecond latency means that Voxis is perfectly suited for both the live spoken word and for singing. It's therefore an ideal tool for live sound engineers (including Front of House), recording engineers mixing live material, audio engineers working in broadcast (specifically live events/sports), and AV professionals managing conferences/live events. In addition, its architecture - based on CEDAR's latest advances in deep neural networks - ensures it can comfortably manage a wider range of noise problems than alternative solutions.

Voxis will be generally available from 27th August 2026.
