

Connection cables from Sommer cable now RFID-ready

The relyos hand-held scanner or the relyos GATE counts every incoming or outgoing product in your logistics. Sommer cable's connection cables are now available premade with a built-in RFID transponder (article suffix "S") and can be tracked using the relyos system. Unexplained cable and equipment shrinkage is now a thing of the past – always keep track of your flow of goods.

The new connection cables are equipped with durable RFID transponders that are attached at the cable end. For XLR cables, for example, these are attached to the side of the male plug to ensure that the transponders do not interfere with installations and normal stage applications. The transponder is firmly and securely fixed by a shrink tube that is covered with the relyos logo. With a lifespan of about 30 million read operations, these chips are ideally suited for heavy use in everyday event applications.

Compared to NFC tags, UHF tags have a significantly greater range and constant transmission power. They can be scanned quickly and efficiently – either with a hand-held scanner or the specially developed scan GATE from relyos, which is unbeatable in terms of reliability and speed. The relyos system is fully compatible with leading rental software such as EasyJob and Rentman. In addition, an API interface enables seamless connection to an existing ERP system.
