Erica Synths EDU DIY FM Drum

Introducing an FM Drum circuit that fuses analog punch with metallic tones of FM synthesis. This DIY kit offers a wide range of sounds for your patches, from kicks to toms, metallic clangs and more – a great addition of versatile, rhythmic elements to your system.

Erica Synths and Moritz Klein have developed a series of educational DIY kits under the brand name mki x es.EDU with one specific goal in mind: to teach people with little-to-no prior experience how to design analog synthesizer circuits from scratch. What you'll find in the box is not simply meant to be soldered together and then disappear in your rack. Instead, they want to take you through the circuit design process step by step, explaining every choice we've made and how it impacts the finished module.

NB! All kits in these series are simple and come with extensive user manuals which can be downloaded separately, therefore they will not provide customer support in case your DIY build fails to function or similar.
