

Erica Synths Graphic Resonant Filterbank & Expander

The Graphic Resonant Filterbank (FB) is a ten-band analogue filterbank with digital control over each bands' boost or cut. Each band can be controlled individually via CV or manually, while complex control configurations turn the filterbank into an unconventional multimode filter and even an instrument in its own right when played with various resonance settings.

"The new Erica Synths RESONANT FB is an unavoidable sonic masterpiece. After more than 40 years dealing with electronic music synthesis, it is rare for me to get sonically surprised... THIS DID! It is delightfully addictive, surprisingly fresh, powerfully gratifying, direct, responsive, allowing for a plethora of unique sounds, in any of its different modes. (And yes, you can save your own presets too!) So, Try it at your own peril: You will not come back sonically the same! (I know: sounds huber cliché: BUT IT IS DARN TRUE!) I plan to bring it to our "Hans Zimmer Live" US 2024

Erica Synths introduces the Graphic Resonant Filterbank & Expander
