Erica Synths Mutant Machine

The Machine began as a quest to create a rich-sounding eurorack snare drum synthesis module to complement the existing Mutant Drums. The project quickly became too large and costly to justify the module being capable only of snare drum sounds. So, the decision was made to learn from the architecture of the TR-909’s snare and kick circuits, to develop a module capable of generating multiple forms of analog percussion, and various other effects.

Like the other Mutant Drums, the Machine has its roots in classic analog percussion synthesis. Even though it can create alien sounds, it still can deliver those classic 909 house snares and kicks if you want them. There are no microcontrollers in the Machine. The signals and waveforms are all generated by discrete components and ICs, for a distinctly analog sound, and user experience. Now redesigned by Erica
