# Eventide H9000 supports RNBO Patch Import

Eventide, a company with expertise in audio technology for more than 50 years with award-winning studio processors, effects pedals, plug-ins, and broadcast products, is proud to announce a cooperative development with Cycling '74 that allows Max programmers to use the RNBO environment to export patches to Eventide's flagship H9000 multi-effects processor.

Max, Cycling '74's visual programming environment that connects sound creation and processing elements with virtual patch cords, has a more than 30-year legacy as a creative platform. That legacy enters a new phase with RNBO, which allows the sound of Max to be exported as standalone code for web, as plug-ins for DAWs and to compatible hardware. With the addition of RNBO support, Eventide H9000 owners can develop and run new effects of their own creation on their H9000.

Eventide H9000 supports RNBO Patch Import

"This is great news. With RNBO support," says Tony Agnello, managing director?of Eventide, "the immense processing power of the H9000 becomes a host for the creativity of Max programmers. We're looking forward to seeing what they develop."

"Bringing RNBO to Eventide's H9000," says Cycling 74 CEO David Zicarelli,"offers our users the ability to deploy their personal creations to an incredible DSP engine alongside a wealth of existing effects. We're excited to introduce this option for RNBO users seeking the ultimate hardware platform for code export."
