FLUX:: Immersive MiRA 25.04 Service Release

The FLUX:: team announces MiRA 25.04, the first update since the product introduction in January this year. This new release is packed with enhancements designed to elevate your user experience and to refine and improve existing features. The MiRA 25.04 release is a free update for all users with a valid MiRA perpetual license or active MiRA subscription plan and is available now in FLUX:: Center.

FLUX:: has added an in-app help feature to the IO setup page. This helpful toolbar will guide you through configuring input and output settings for three typical use cases: studio, live show, and system tuning. Additionally, when modifying the input reference number of channels, an automatic offset for additional channels is now applied.

FLUX:: has made numerous optimizations to enhance your experience:

- Drag and drop captures between sessions
- Improved transfer function with octave-phase smoothing
- Frequency-depending auto-pause
- Enhanced robustness of the analysis

The robustness of the MiRA SampleGrabber has been significantly improved, particularly in the following cases:

Phoca PDF

- Handling loops in DAWs
- Reconnection stability
- LUFS measurement reliability
- IO setup configuration

In addition to these key updates, FLUX:: focused on improving the overall stability and consistency of the software. For detailed information, please refer to the full release notes here.
