

Mayer EMI introduces Vibes in DAW Mode

With the release preview of the Vibes in DAW Mode, Mayer EMI is continuing its philosophy of improving and updating its existing synthesizer portfolio. The Vibes, a 24-voice polyphonic, true stereophonic digital synthesizer is enriched with a fully integrated, browser based performing and editing UI which makes the vision of creating, sequencing, mixing and performing in an all-integrated synthesizer becoming true. The combination of the Extended Virtual Analog (XVA) sound engine with a powerful editor built on web technology, accessible from any browser within the local network, makes every Vibes a dream instrument for sound designers and performers. Experience fast creation of sounds, clips and performances – while building on top of the XVA synth engine with it's truly immersive sound and user experience.

Despite its compact size, the Vibes is a professional instrument in its truest form. Combining a state-of-the-art platform design, craftsmanship, sound quality and rich connectivity, the Vibes sets a new benchmark in modern synthesizer design and useability. Furthermore, the newly created, browser based editor makes it easy to integrate in any sound and performance vision. Pushing software development is equally as important as the intuitive design of hardware instruments. Hence, the Vibes comes bundled with a set of improvements and new software features like

Vibes Connect.

Vibes Connect, the web browser based performing and editing app, makes the creation of live performable arrangements easier than ever before. In combination with the existing Extended Virtual Analog (XVA) sound engine the Vibes truly gives musicians unlimited potential for creative expression and ability to perform live. Users have direct access to the clip launcher and related mixer controls for Live performing. For Live editing in DAW mode, Vibes Connect provides a full featured Midi Editor, direct recording and editing, all with direct access to the vibes in a browser web app. Full access to the 21 stereo mixer channels allows live mixing and signal routes of all audio paths. The resource management gives full access to all manageable files in a workflow based approach and completes the Vibes Connect user experience.
