Moog One Firmware v1.5.0

Firmware v1.5.0 substantially expands Moog One's CV Input/Output capabilities. This update also introduces new user-accessible tuning, voice card, and system calibrations, as well as bug fixes and feature improvements. See a detailed list of all new features and improvements in the Moog One Firmware v1.5.0 Release Notes.

In This Firmware Release

- CV Input/Output implementation greatly expanded
  - 10 new CV/Pedal Input Functions (including Expression)
  - 14 new CV Output Sources
- New user-facing calibration routines
  - Voice Card Calibrations ensure optimal tuning and response of all components of the analog voice circuits.
  - System Calibrations ensure proper functionality of the inputs, outputs, potentiometers, and the LHC.
- Sustain and Sostenuto functionality is now fully implemented
- New "Return to Zero All" command
- Sequences across all synths now stay in sync when Master Tempo is adjusted
- Fix for stuck notes in Unison Mode
