Noise Engineering Granulita Versio

Noise Engineering, known for their innovative platform modules, has released Granulita Versio, a granular chord resynthesizer and shimmering reverb. Granulita Versio offers a simple solution to a complex modular problem. Chords, while beautiful, are difficult and resource-heavy to patch in a Eurorack system. Granulita solves this by generating harmonies for any input signal using a unique granular process. The Chord and Voice parameters allow the user to choose a chord and the note that follows the input signal. The unquantized Pitch parameter adds an extra layer of harmonic options via transposition, detuning or vibrato.

For fans of granular processing, the Count and Length parameters will be familiar, Granulita can generate any number of grains from zero to 32, and grains can be 16 milliseconds to four seconds long. A modal trigger input and manual button add to the granular fun: freeze grains, sync their playback to an external clock or tap tempo, or use a trigger sequence to manually fire off grain playback. No granular module would be complete without some atmospheric effects, so Granulita also adds the simple Verb parameter to add in some space. Below noon, small echoes put a patch in a realistic space – but turn up the parameter to add in shimmering octave overtones and feedback into infinity.
