Noise Engineering Multi Repetitor

Noise Engineering, known for their unique and compact utilities, has released Multi Repetitor, an algorithmic trigger sequencer and sequel to their classic Numeric and Zularic Repetitor trigger generators. Multi Repetitor has been completely rethought from the originals, and takes the core features of the version one designs into a whole new realm. Rhythm generation starts with the three rhythm banks: choose from Zularic, Numeric, or the newly developed Euclidean-derived linear rhythms, then use the Prime fader to scroll through base rhythms on the fly. Like its predecessors, it features four trigger outputs, now with dedicated performance faders that modify the rhythm output.

The newly rethought – and reversible – interface based adds extra parameters for more control of all four outputs. While it keeps the clock and reset inputs, Multi Repetitor also features an internal tap-tempo clock for standalone sequencing. Finally, this version adds four accent gate outputs to the interface. The impetus for these changes, according to the team, was to make the module fit better into compact percussion systems while still being a fun generative sequencer for larger systems.

While it’s possible to get deep into rhythmic modification with the extensive

patterns, modification algorithms, and accent options, Multi Repetitor is designed to be a plug-and-play rhythm sequencer. Noise Engineering said that one of their goals was to make it easy to tweak parameters by ear and jam with no preparation required.

Features:

- Standalone play: tap in a tempo, patch up the outputs, and you've got a groove
- Sequence triggers and accents for up to four voices in your systems
- Choose from Zularic, Numeric, or Euclidean-derived base rhythm banks
- Select different base rhythms from the banks using the Prime fader
- Use three different algorithms to modify each output's rhythm with the performance faders
- Modulate your rhythms with full CV control over faders and banks, and keep things in sync with external clock and reset inputs
- Plug-and-play operation: simple interface designed for performance is easy to use out of the box

Multi Repetitor is in stock and shipping from Noise Engineering and retailers starting January 22nd, 2026. The price is US$320. Multi Repetitor begins shipping on January 22nd at the website below and at retailers globally.
