Novation Launch Control XL 3 V1.1 Update

Novation today releases the first major firmware update for its Launch Control XL 3 control surface. Available now via Novation Components, the v1.1 update adds compatibility for more DAWs, enhanced control for external hardware, and deeper customisation. The v1.1 firmware adds powerful new capabilities for users working in HUI-compatible DAWs and those controlling external hardware. It also brings numerous quality-of-life upgrades designed to improve all supported workflows.

The V1.1 Update includes:

- Mackie HUI support: Launch Control XL 3 now supports additional DAWs - including Pro Tools, Reaper, and Studio One - right out the box.
- Expanded MIDI routing: With flexible USB-to-DIN MIDI passthrough, it’s even easier to configure hybrid setups with merged control data and channel filtering.
- Encoder acceleration curves: Encoder response can now be adjusted for more precise, expressive control.
- Fader pickup: Faders can be set to “pick up” their previous position rather than immediately jumping to a new value when moved, enabling smoother transitions when mixing or performing.

- Fader preview: Pressing Shift and moving any fader displays its parameter value on Launch Control XL 3’s OLED screen.
- Faster Custom Mode selection: Custom Modes can now be selected by holding down the Mode button, selecting a mode, and releasing it.

Owners of Launch Control XL 3 can update their hardware now.
