Solid State Logic SpringVerb

Solid State Logic announces the launch of SpringVerb, part of the SSL ‘Verb’ collection of plug-ins, which now features SpringVerb, PlateVerb, and GateVerb. SpringVerb imparts the unmistakable vibe of classic spring reverb into your productions, combining authentic vintage hardware character with the flexibility of modern SSL control. Carefully modelled on the most legendary spring tanks ever built, SpringVerb embodies the authentic tone and texture behind countless classic recordings across rock, pop, electronic music, reggae/dub, and more. It is perfectly suited for guitars, snares, vocals, keys, and synths.

SpringVerb is a welcome addition to the Verb family of plug-ins: All three plug-ins deliver their own distinct sonic textures: spring for retro bounce, plate for smooth studio polish, and gated for dramatic punch. As a collection, they give producers versatile tools to shape mood, space, and impact across any style of music. Spring reverbs naturally emphasise the mid and high frequencies that can quickly take over a mix. SSL SpringVerb gives you precise control over this behaviour, with dedicated damping to tame problem areas before they build up, plus intelligent ducking to keep the effect sitting exactly where it is needed. While classic hardware tanks are limited by their physical design, SpringVerb goes a step further, offering

deep, musical parameter control that unlocks sonic shaping that would be impossible on traditional units.

Key Features:

- Delivers the unmistakable sound of vintage spring reverb.
- Three spring models: Find the texture that fits your use-case:
  a) Famous space-age echoes
  b) Classic rackmount spring tank
  c) The go-to choice for dub, used by King Tubby and Lee Perry
- Spring quantity: add more springs for more density and complexity.
- Adjustable reverb characteristics: customise time, tension, pre-delay, and stereo width for a level of control not possible with many hardware tanks.
- Advanced SSL control: add analogue drive, ducking, and frequency damping to shape the reverb exactly to your needs.

SpringVerb provides deep creative control over how the reverb is expressed. For instance, users can smoothly fade between single, double, and triple-springs. The more springs, the denser and complex the reverb will become. Meanwhile, the Time knob controls decay length, with the Sync button allowing it to lock to tempo-based values when desired. The Freeze button stops new input and will create an infinite reverb tail until it is turned off.

Users also have creative flexibility by adjusting the spring tension, which changes the reverb’s character. Tightening the springs makes the sound travel faster making it feel more controlled, while loosening them adds the classic “twanginess” of spring reverbs, with more noticeable bouncing echoes. A dedicated Width knob can be rotated fully counter-clockwise to reduce the stereo image of the reverb to mono; many vintage spring tanks were wired in mono, so this can is one way users can recreate a vintage sound. The stereo image can also be expanded beyond 100% to push the reverb out to the sides of the stereo field.

At the heart of SSL SpringVerb is the interactive Spring Tank: a visual recreation of that which is found on the vintage hardware, but fully interactive to your settings. The springs expand or contract with the Tension control (above). For creative bursts, one can set the Strength knob and trigger the Boing button to unleash chaotic resonance. Other powerful controls include a pre-delay, which can impart a rhythmic slap back effect while locking to a host tempo; a Drive section that can add saturation to the input signal mimicking the harmonic richness of hardware; and damping knobs which can remove certain frequency components helping users 'tune' the specific frequency response of the reverb.
