

## SSL Acoustifier

Solid State Logic announces its latest plug-in, Acoustifier, a powerful and unique new D.I.-to-mic simulation plug-in that transforms an acoustic guitar D.I. signal into a rich, studio-quality recording. By emulating the sound of a dual-microphone setup, Acoustifier is able to enhance a dry guitar tone with its advanced D.I.-to-microphone modelling and onboard SSL-grade EQ, compression, and reverb. Available perpetually, at an introductory price of only \$49 (worth \$99), or as part of the ever-expanding Complete Access Bundle subscription from just \$19.99 per month, Acoustifier is a brand-new, all-in-one solution for achieving the best possible D.I. tone - regardless of location or access to high-end recording equipment.

Made for studio professionals, musicians, and performers alike, Acoustifier breathes life into D.I. signals, recreating the sound of professionally recorded acoustic guitar tracks, ideal for situations where capturing a guitar's natural tone with high-quality microphones is not an option. Whether mixing in-the-box, performing live, or on the road without access to a recording space, Acoustifier's advanced tone modelling allows users to select their guitar body type with a choice between three classic microphone styles, delivering an authentic emulation of a stereo studio recording.

By matching your guitar to the appropriate acoustic body type, you can achieve an authentic DI-to-mic simulation. Choose from four popular acoustic guitar models: two dreadnought variations, a jumbo/large body, and a concert/orchestra model. This allows you to sculpt natural, studio-quality acoustic tones, captured using your choice of three classic microphone types: dynamic, condenser, or ribbon. A range of mic configurations are also available, including XY and spaced pair setups, with the option to blend body and neck microphone signals to craft your ideal tone.

Acoustifier includes a built-in EQ and real-time frequency analyser, designed for fast and effective tone shaping, eliminating the need for additional plug-ins in your signal chain. At its core is a quick-access tilt band, perfect for instantly shifting the tonal balance toward the high or low end. For more precise control, Acoustifier's EQ also features high-pass and low-pass filters, along with three fully customisable mid bands to fine-tune your tone. All adjustments are made via an intuitive, node-based EQ graph, complete with a frequency analyser for real-time visual feedback.

Acoustifier features a powerful onboard reverb engine that adds depth, space, and realism to any dry guitar signal. Derived from SSL FlexVerb's 'mix-ready' reverb algorithms, Acoustifier's built-in reverb offers a curated selection of room, chamber, plate, and hall reverbtypes, delivering studio-grade ambience directly from Acoustifier's interface. Whether it is the lush resonance of a grand hall or the intimate feel of a small room, the onboard reverb is able to shape its spatial character to fit seamlessly into any mix.

To maintain clarity and focus, Acoustifier also includes an integrated reverb ducking feature. This dynamic control reduces the reverb level in response to the guitar, whether sourced from the D.I. path, a pre-reverb tap, or an external sidechain, ensuring the performance stays front and centre, and never lost or overwhelmed by the reverb effect.

Acoustifier also features an integrated compressor section, offering dynamics that range from subtle smoothing to aggressive tone shaping. The Auto-Gain feature level-matches your adjustments, helping you dial in dynamic control with confidence. For added flexibility, a dedicated Mix control allows quick and intuitive parallel compression blending. Finally, the compressor can be placed post-reverb, providing even more control over the processed signal within a mix.

## Acoustifier Key Features

- **DI-to-Mic Simulation:** Featuring four popular acoustic guitar models, two dreadnought variations, a jumbo/large body, and a concert/orchestra model for accurate tone matching to the desired guitar type.
- **Classic Microphone Modelling:** Choose between three classic microphone types: dynamic, condenser, and ribbon - available in stereo XY and spaced pair configurations.
- **Dedicated EQ:** Tone can be shaped with a ready to go EQ, featuring an FFT analyser, HP & LP filters, fast-access tilt band and fully configurable parametric bands.
- **Onboard reverb:** Equipped with room, hall, plate, and chamber reverb types, the reverb also includes built-in reverb ducking for enhanced clarity over the sound.
- **Integrated Compressor:** Delivers effortless dynamic control, with mix knob for easy parallel compression.
- **'HQ' Mode:** Useful for intelligent oversampling and higher quality results.

## **Solid State Logic launches the Acoustifier Plug-In**
