Supercritical Redshift 6 1.6

Firmware Update 1.6 introduces the new polyphonic SEQ: POLY sequencer engine and macros, along with eight new factory presets designed to showcase their capabilities. Each multitimbral part in Redshift 6 supports its own sequencer, allowing up to six independent sequencers to run in parallel. The SEQ: POLY engine handles per-part sequencing, making it easy to build polyphonic sequences across multiple parts.

Macros provide access to eight assignable controls. Each Macro can control multiple

parameters simultaneously, including parameters across different parts. This enables complex changes with a single knob and makes Macros especially useful in live performance.

Added:

- New sequencer engine: SEQ: POLY
- Macros

Improvements:

- Drive is now a modulation destination
- 8 new factory presets

Fixed:

- Fixed all known bugs

The new firmware update for the Redshift 6 is now available on the website below.
