

Sweet Acoustic Textures releases Basset Horn for the Kontakt Player

Sweet Acoustic Textures - Basset Horn offers both a traditional virtual instrument and a random acoustic textures generator.

In addition to the usual techniques, you can work with bisbigliando, flatterzunge, subtone... using, according to your needs, keyswitches or note density, velocity range and spatialization controls.

The 3894 selected samples were recorded with an astonishing clarinetist of the new Parisian generation, in short and neutral acoustics, without any concession choosing the gears, then treated with the greatest care in the respect of the instrument tone.

If you need the rare tone of the basset horn for your compositions or if you are looking to create unheard acoustic textures, Sweet Acoustic Textures - Basset Horn is definitely made for you.
