Voxengo Peakbuster 1.4

Voxengo releases Peakbuster version 1.4, an attack-phase boosting and harmonic enhancement plugin for professional music and sound production applications, available in AAX, AudioUnit, VST, and VST3 plugin formats, for macOS and Windows computers. Version 1.4 features a redesigned user interface.

The amount of effect can be chosen independently for the lower and higher frequency ranges: this permits use of Peakbuster on a variety of program material, both full mixes and individual tracks.

Additionally, due to the nature of the algorithm’s design, Peakbuster applies a unique harmonic coloration or enhancement: so, even if the gain adjustment meter shows only a minimal transient boosting amount at a given time, the plug-in still transforms the sound being processed in a way that to some engineers may sound “on a completely another level”; we at Voxengo would call it “beyond tube warmness”.

Peakbuster features:

- Automatic transient boosting
- Selectable processing band count
- Stereo processing
- Up to 8x oversampling
- 64-bit floating point processing
- Preset manager
- Undo/redo history
- A/B comparisons
- Contextual hint messages
- All sample rates support
- Zero processing latency
