

Baby Audio Warp

Baby Audio continues its tradition of closing out the year with a free plugin release. For 2024, the company unveils Warp, a standalone plugin based on the beloved Warp module from Transit 2 - Baby Audio's best-selling collaboration with Andrew Huang.

Warp controls a powerful algorithm that lets users speed up or slow down audio with unprecedented clarity, free from the typical artifacts. The Stretch knob takes things further, giving control over pitch independent of time. This allows for extreme effects such as slowing down while pitching up.

Features:

- Pristine, artifact-free varispeed control to effortlessly speed up or slow down audio.
- Use the Stretch knob to control pitch independent of time for unhinged audio mangling. (Set to 50% to retain the pitch).
- Mix knob for blending the 'warped' signal with the original audio source.

Transit 2, developed in collaboration with Andrew Huang, is a motion-enabled multi effect that contains 28 internal effects modules - many of which are just as powerful as some standalone plugins. Newly released in Transit 2, the Warp module became an instant favorite among users for its radical varispeed effects and creative pitch and time stretching.

Warp is compatible with all major DAWs for Mac and PC. An iOS version is also available on the Apple App Store, making it accessible for mobile music creators.
