Focusrite expands Focusrite Control 2 Compatibility

Focusrite is expanding Focusrite Control 2 compatibility to Scarlett 3rd Gen, Clarett+, Clarett USB, and select Scarlett 2nd Gen USB audio interfaces — specifically the 6i6, 18i8, and 18i20. Focusrite Control 2 is a comprehensive app for controlling Focusrite audio interfaces from your computer. It offers more functionality and an intuitive experience than Focusrite Control, with an overhauled user interface and mixer design. For users of the newly supported ranges, Focusrite Control 2 is available now. Users moving from Focusrite Control will need to uninstall it first.

Clearer metering makes it easier to monitor signal levels at a glance, ensuring perfect levels every time. Intuitive routing makes setup configuration faster. Multi-interface control lets users switch between multiple USB-connected interfaces without disconnecting and reconnecting them, currently available on macOS. Automatic updates ensure users are always running the most current version, and comprehensive screen reader support has also been designed from the ground up with visually impaired musicians.

For Windows users, Focusrite Control 2 maintains driver compatibility automatically, ensuring stable performance without any action required from the user. The expansion reflects Focusrite’s commitment to sustained support for owners of its devices — a relationship with its users that extends well beyond the point of purchase. Bringing more ranges under a single application gives Focusrite device
